### 4.6 Related Rates

## Objectives: <br> - I can write a model to represent a situation <br> - I can find the rate of change of one value given another

Process:1- Understand the problem2- Write down what you know/need to know. Identifyvariables and constants.
3- Write an equation relating the variables.
4- Differentiate with respect to $t$.
5- Solve for the unknown value.

1. The radius of a sphere is changing at a rate of $2 \mathrm{in} / \mathrm{sec}$. A) How fast is the volume of the sphere changing when the radius is 3 inches?
B) How fast is the surface area of the sphere changing when the radius is 3 in .?
2. The sides of a cube are increasing at a rate of $4 \mathrm{in} / \mathrm{sec}$.
A) How fast is the volume increasing when the length of a side is 2 inches?
B) How fast is the surface area increasing when the length of a side is 3 inches?

# 3. A 34 foot ladder is sliding down the side of a building. The base is moving away from the building at a rate of $3 \mathrm{ft} / \mathrm{sec}$. <br> A) How fast is the top of the ladder falling down when the base is 16 feet away? 

## B) How fast it the angle with the building changing when the base is 16 feet away?

4. Melanie is flying a kite at a height of 400 feet. The wind is carrying the kite away at a horizontal speed of $20 \mathrm{ft} / \mathrm{s}$. How fast must Melanie release the string when the kite is 500 feet away in order to maintain the height of 400 ft ?

> 5. Two cars are moving toward the same intersection on perpendicular streets. Car $A$ is travelling at $30 \mathrm{mi} / \mathrm{h}$ and car $B$ at $45 \mathrm{mi} / \mathrm{h}$. How fast is the distance between them changing when $A$ is $1 / 2$ mile away and $B$ is $1 / 4$ mile away.
6. A spotlight is moving in a linear direction at a speed of $\frac{\pi}{4}$. The light beam is tracing across uniform cloud cover that is ${ }^{4}$ 500 ft high. What is the speed of the beam on the clouds when the spotlight forms an angle of $60^{\circ}$ with the ground?
7. A dinghy is pulled toward a dock by a rope from the bow through a ring on the dock 6 ft above the bow as shown in the figure. The rope is hauled in at a rate of $2 \mathrm{ft} / \mathrm{sec}$.
A) How fast is the boat approaching when 10 ft of rope are out?
B) At what rate is the angle $\theta$ changing at that moment?
8. You are videotaping a race from a stand 132 feet from the track, following a car that is moving at 180 miles per hour ( $264 \mathrm{ft} / \mathrm{sec}$ ). About how fast will your camera angle be changing when the car is right in front of you? A half second later?
